

Synthetic Grass Cleaning Process: Service Process

Synthetic Surfaces get tired. They get a build-up of contaminants that form a crust on the surface with algae and moss developing on the synthetic grass fibres.

ASGC Systems has developed a unique process that thoroughly rejuvenates synthetic grass surfaces.

The process uses a washing, brushing and rinsing action that has replaced the “High Pressure” cleaning technique.

This system is used because it causes less wear and tear on the fibres while thoroughly removing crusting and deep down compacted contaminants including algae and moss.

After contaminants are removed the carpet is brushed and new tennis court sand is applied to the desired level. A chemical treatment to inhibit algae and moss growth completes this unique process.

ASGC Systems provide maintenance solutions for all synthetic grass services. Our unique cleaning system cleans more thoroughly and has you back on your court faster than traditional systems.
